Figures 2f and 2g were incorrectly labelled as 2014 in the original submission when they actually were taken from the declining phases of the October 2010 and the August 2003 eruptions, respectively. However, these two images were chosen because they nicely show the characteristic behaviour from the 2014 eruption, in particular the passage from the very low fountaining to the final Strombolian phases. In Fig. 2f (for the October 2010 eruption), north is actually towards the reader (we have provided a corrected north arrow, in red, in the figure provided in the corrigendum). For Fig. 2g (for the August 2003 eruption), north is in the same direction as indicated in the image in the original submission.

**Figure 2.** Panel (f): declining phases of the October 2010 eruption. Panel (g): declining phase of August 2003 eruption. The white cross is the position of the active vents of these two eruptions. The photo for the 2010 eruption is taken from <http://www.delajartre.com/octobre2010.html>; the photo from the 2003 eruption is taken from <https://fr.fotolia.com/search?serie=4444188>.
